1 INTRODUCTION

The concern about an increased observation of unknown damage to forests in Europe led in the 1980's to the establishment of the following two European programmes for the protection of forests against atmospheric pollution and other stress factors:

The International Cooperative Programme on Assessment and Monitoring of Air Pollution Effects on Forests (ICP-Forests) and the European Union Scheme on the Protection of Forests against Atmospheric Pollution. In the framework of these two programmes a large-scale 16x16km transnational monitoring network (level I) was established and on this grid annual crown condition surveys have been carried out since 1986/87. In addition to these observations surveys of the forest soil condition and of the chemical content of needles and leaves were carried out in 1995 (Stefan et al. 1997).

For the intensive monitoring programme (Level II) more than 860 permanent observation plots have been established in Europe with the aim of investigating key factors and processes at the ecosystem scale. The foliar survey at Level II is mandatory and the analysis must be carried out at least every two years (1995, 1997, 1999, 2001, 2003).

A high quality and comparable laboratory standard in all countries is indispensable for a European-wide survey of the state of forests. Important steps on this way have been the publication of the "Manual on methods and criteria for harmonised sampling, assessment, monitoring and analysis of the effects of air pollution on forests" (UN-ECE, Hamburg and Prague 1994) and the performance of the first European Foliar- Interlaboratory Comparison Test on two certified standards (BCR 100-beech leaves and BCR 101 - spruce needles) by 24 laboratories from 21 countries, organised by France in 1993.

The intensive discussion of the forest foliar expert panel in As/Norway (1994) ended with the recommendation of a second test with 4 unknown samples (two spruces, one pine, one oak) during the running level-II monitoring programme. This was organised by Germany in 1995/96 and subsequently discussed by the expert panel in Vienna/Austria in 1997. The expert panel decided to call for a complete repetition and authorised the Landesumweltamt North-Rhine-Westfalia (LUA) to arrange interlaboratory comparison tests on foliage every two years. The 3rd test (Bartels 1998) with 5 unknown samples and its consequences for the analytical quality management were intensively discussed in Bonn in 1999 and ended with a revision of Part IV "Sampling and analysis of needles and leaves" of the above mentioned manual (Stefan et al. 2000).

52 Laboratories from 29 European countries took part in the 4th Needle/Leaf Interlaboratory Comparison Test 1999/2000. In comparison with the 3rd test, the results show a distinct improvement of analysis quality of European laboratories working on the issue of forestry analysis (Bartels 2000).

The 5th Interlaboratory Comparison Test was also organized by the LUA (Bartels 2002). In general, the results show good analytical quality in the participating laboratories, but it was very surprising that some laboratories have problems with carbon in foliar samples. The results were discussed by the Expert Panel in Prague/Czech Republic in April 2003. The Panel discussed the difficulties that some laboratories encounter in using new laboratory equipment and the lack of experienced technical staff. Good analytical quality can only be obtained by daily practice and with good quality control. This quality practice must also become a tradition for each laboratory and for each member of the staff.

Because of the good results, the Panel has established smaller tolerable limits of \pm 15% for zinc and manganese and of \pm 20% for copper.

Following the the retirement of Mr. Bartels from the Panel, the Forest Foliar Coordinating Centre (FFCC) organised the 6th Interlaboratory Comparison Test. FFCC conceived a web-based interface to an Oracle database to which data input and validation could be made via internet by the participating laboratories. The results of this Interlaboratory Comparison Test were evaluated according to DIN 38402/42. The results of the 6th Interlaboratory Comparison Test show generally a good analytical quality in foliar analyses. Only a few of the laboratories had to adjust to the results from their ringtest and others had to change their methods (e.g. dry ashing). Also, a well trained staff is the basis for good results and most of the labs are now using quality control charts.

To improve the quality of foliar analysis, the Expert Panel and the FFCC decided to carry out this ringtest annually. Ringtests should not only be a check of the level II data quality, but they should also support the laboratories to get better results before they send the next level II results to the Programme Coordinating Centre (PCC). That was the reason why the 7th Interlaboratory Comparison Test was started in 2004.

Till now, there were no direct connections between the foliage results of the level II survey and the results of the annual interlaboratory tests. To link this quality information directly to the level II datasets, changes where made in the level II submission forms (*.fom and *.foo). At the Task Force Meeting 2005 and at the 9th Expert Panel Meeting 2005 (Newtownmountkennedy / Ireland) these changes were accepted. Also the coded results of the 8th Interlaboratory Comparison Test will be sent to the PCC and the Joint Research Centre (Ispra). With this information it is possible to link quality information directly with level II monitoring results.

The 9th Interlaboratory Comparison Test was the last one financed within the Forest Focus programme. To avoid the same situation like in the 6th Test (no co financing from EC), other sources for financing must be found for this Interlaboratory test programme in future. A great majority of the participating laboratories agreed to pay a participation fee in future to continue this annual test programme, if there are no other sources for financing.

2 TASK, MATERIAL, PARTICIPANTS AND EVALUATION

2.1 Task

The Forest Foliar Coordinating Centre established the following timetable:

- Informing the participating labs (April 2006)
- Registration of 54 participants via internet (8th July 2006)
- Submission of the ring test samples (End of July 2006)
- Input of the results from the labs (October-December 2006)
- Deadline of data input (31th December 2006)
- Evaluation according to DIN 38402/42 (January/February 2007)
- Final Report (February 2007)

The mandatory parameters S, N, P, K, Ca, Mg must be analysed, optional parameters Zn, Mn, Fe, Cu, Pb, Cd, B and C can be analysed and some additional elements are possible. The units and all possible elements are shown in figure 1.

Figure 1: Elements and units

| | | | | | | | | | | | | | | | | | | | |
|-------------------------|-------------------------|------------------------|-------------------------|------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-----------------|-------------------------|-------------------------|-------------------------|-------------------------|---------------------|-----------------|-----------------|
| 1 H | | | | | | | | | | | | | | | | | | | 2 He |
| 3 Li µg/g | 4 Be | | | | | | | | | | | | | | | | | | 10 Ne |
| 11 Na µg/g | 12 Mg mg/g | | | | | | | | | | | | | | | | | | 18 Ar |
| 19 K mg/g | 20 Ca mg/g | 21 Sc | 22 Ti µg/g | 23 V µg/g | 24 Cr µg/g | 25 Mn µg/g | 26 Fe µg/g | 27 Co µg/g | 28 Ni µg/g | 29 Cu µg/g | 30 Zn µg/g | 31 Ga | 32 Ge | 33 As µg/g | 34 Se µg/g | 35 Br µg/g | | 36 Kr | |
| 37 Rb µg/g | 38 Sr µg/g | 39 Y µg/g | 40 Zr µg/g | 41 Nb | 42 Mo µg/g | 43 Tc | 44 Ru | 45 Rh | 46 Pd | 47 Ag | 48 Cd ng/g | 49 In | 50 Sn µg/g | 51 Sb | 52 Te | 53 I | | 54 Xe | |
| 55 Cs µg/g | 56 Ba µg/g | 71 Lu | 72 Hf | 73 Ta | 74 W | 75 Re | 76 Os | 77 Ir | 78 Pt | 79 Au | 80 Hg ng/g | 81 Tl | 82 Pb µg/g | 83 Bi | 84 Po | 85 At | | 86 Rn | |
| | Mandatory | | | | | Optional | | | | | | | Additional | | | | Not possible | | |

For each element four replicates per sample are necessary within this Interlaboratory Test. All samples should be dried at 80°C before analysis (moisture content approximately 5%) and results must be calculated on dry weight (105°C).

For a deeper evaluation - all participant laboratories received a questionnaire with purpose to obtain information about the status of their quality control systems and they were asked if they have analysed level II foliar samples in 2006.

2.2 Material

At the end of July 2006 the Austrian Federal Research Centre for Forests, Natural Hazards and Landscape (BFW) sent four dried and powdered plant samples to 54 European laboratories in 28 countries.

The samples consisted of:

1. Spruce needles (Germany)
2. Spruce needles (Germany)
3. Oak leaves (United Kingdom)
4. Oak leaves (Hungary) – same sample like in the 6th Test

All materials were dried, ground and homogenised. Before the samples were sent they were once more homogenized in the BFW-laboratory and were filled in PE-bags. Homogeneity was tested for each of these four samples by analysing the nitrogen and carbon content in eight randomly selected sub samples. No variation was found between the results of these eight samples, and they were therefore considered to be homogeneous.

I have to thank to Günther Kießling (Germany), Hans-Peter Dietrich (Germany) and Francois Bochereau (United Kingdom) for sampling and preparing these samples for this test.

2.3 Participants

Table 1 shows the number of countries and laboratories taking part in the nine interlaboratory comparison tests.

Table 1: Number of countries and laboratories taking part in the nine interlaboratory comparison tests

| Interlaboratory Comparison Test | Number of countries | Number of laboratories |
|---------------------------------|---------------------|------------------------|
| 1 st | 21 | 24 |
| 2 nd | 25 | 39 |
| 3 rd | 29 | 51 |
| 4 th | 29 | 52 |
| 5 th | 29 | 53 |
| 6 th | 26 | 46 |
| 7 th | 23 | 43 |
| 8 th | 30 | 52 |
| 9 th | 28 | 53 |

With a few exceptions, all laboratories analysed in the 9th Interlaboratory Comparison Test the complete list of mandatory elements and most of the optional elements (s. Table 2).

Table 2: Analysed elements from the participant laboratories (green); no results were sent (grey); level II samples were analyzed this year marked with “X”

| Laborcode | N | S | P | Ca | Mg | K | Zn | Mn | Fe | Cu | Pb | B | Cd | C |
|-----------|---|---|---|----|----|---|----|----|----|----|----|---|----|---|
| 61 | X | X | X | X | X | X | | X | X | | | | | X |
| 64 | | | | | | | | | | | | | | |
| 65 | | | | | | | | | | | | | | |
| 66 | | | | | | | | | | | | | | |
| 67 | | | | | | | | | | | | | | |
| 68 | X | X | X | X | X | X | | X | X | | | | | X |
| 72 | | | | | | | | | | | | | | |
| 73 | | | | | | | | | | | | | | |
| 74 | X | X | X | X | X | X | X | X | X | X | X | X | X | X |

2.4 Data Evaluation

Only four results above the detection limits can be used for the evaluation. Results below the detection limit are marked with "<" followed by the detection limit of the laboratory (e.g. <0.1).

The results of the interlaboratory comparison test were evaluated according to DIN 38402/42. This type of evaluation is easy to do and requires no special computer programme. But, only by using robust statistics are the results really free of manipulation by the test leader. The differences between these two types of evaluation methods are not very big (Bartels 1996, Fürst 2004).

The DIN 38402/42 method identifies three types of outliers. With the Grubbs-test the four replicates from each laboratory can first be checked for outliers (outlier type 1). The next step is to compare the recalculated mean values of each lab with the mean value from all labs as well as with the Grubb-test for outliers (type 2). Finally, the recalculated standard deviation from the laboratories must be compared with the total standard deviation (F-test) to eliminate laboratories with an excessive standard deviation (outlier type 3). Now the outlier free total mean value and the outlier free maximum and minimum mean value of all labs can be calculated. Marked outliers type 1 between the outlier free maximum and minimum mean value are not longer outliers, they can be used for the further evaluation of the interlaboratory comparison test. The last step is to calculate the outlier free statistical values.

With the outlier free mean value for each element/sample and the laboratory mean value the recovery must be calculated and compare with the tolerable limits from table 3. Laboratory results inside this tolerable limits are marked green, outside they are marked orange. This type of evaluation was fixed in the Foliar Expert Panel Meetings of As (1994) and Vienna (1997).

Table 3: Tolerable limits for the mandatory and optional elements

| Element | Tolerable deviation from mean in % | Fixed limits in the Expert Panel-Foliar Meetings |
|---------|------------------------------------|--|
| N | 90-110 | 6 th Meeting - Bonn 1999 |
| S | 80-120 | 6 th Meeting - Bonn 1999 |
| P | 85-115 | 6 th Meeting - Bonn 1999 |
| Ca | 85-115 | 6 th Meeting - Bonn 1999 |
| Mg | 85-115 | 6 th Meeting - Bonn 1999 |
| K | 85-115 | 6 th Meeting - Bonn 1999 |
| Zn | 85-115 | 8 th Meeting - Prague 2003 |
| Mn | 85-115 | 8 th Meeting - Prague 2003 |
| Fe | 80-120 | 6 th Meeting - Bonn 1999 |
| Cu | 80-120 | 8 th Meeting - Prague 2003 |
| Pb | 70-130 | 6 th Meeting - Bonn 1999 |
| Cd | 70-130 | 6 th Meeting - Bonn 1999 |
| B | 80-120 | 6 th Meeting - Bonn 1999 |
| C | 95-105 | 6 th Meeting - Bonn 1999 |

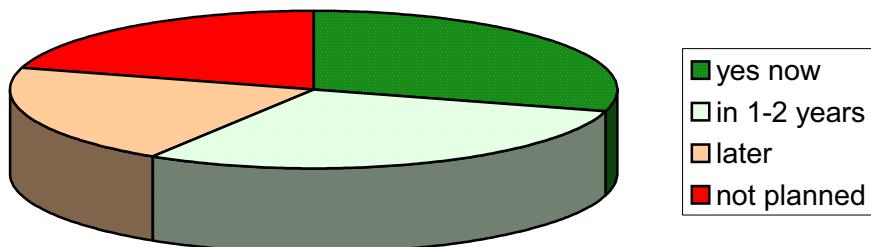

3 RESULTS

3.1 Main results of the questionnaire

All participating laboratories received a questionnaire in order to obtain information about the status and changes of their quality control systems. 46 of the 53 laboratories have so far returned this questionnaire.

The first questions dealt with the accreditation status of the laboratories and the summarized results are shown in figure 2.

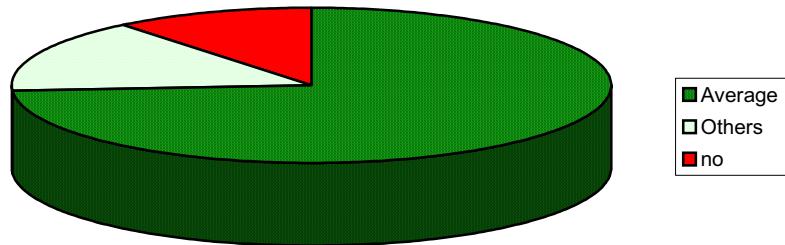

Figure 2: Accreditation status according EN 17025 (n=46)

More than 58% of the laboratories are accredited now (17 labs) or plan an accreditation within 1-2 years (10 labs). In comparison with the last test 2005/06 - 57% were accredited or planned an accreditation soon.

The next important question was about the usage of control charts for quality control. Close to 90% of the laboratories are using control charts, and most of them are using average control chart (appr. 74%) – only 5 of this 46 laboratories are using no control chart.

Figure 3: Usage of control charts in foliar laboratories (n=46)

3.2 Results of the 9th Interlaboratory Comparison Test

Table 4 gives an overview as to which laboratories analysed the test samples well and which encountered quality problems. This evaluation is based on the tolerable limits from table 3. A green marked field means all four samples are analysed well, a grey marked field means no results were sent from this laboratory till end of December 2006. The red marked “<” or “>” mean number of results lower or higher the tolerable limit.

The following participants who have a high percentage of non-tolerable results (above 20%) of the total results have bigger QC/QA-problems in their laboratory:

30 (83.3%), 23 (25.0%) and 74 (23.9%)

Some laboratories are within the tolerable limits (from table 3), but the statistical evaluation shows an excessive standard deviation (outlier type 1 or 3), that means they had problems with their method. These results are marked with “a” or with “c”.

Table 4: Results of the 9th Interlaboratory Comparison Test – results marked with the limits from table 3 (green = all four samples were analysed well; < = too low; > = too high; grey = no results were sent)

The ringtest is evaluated on the basis of fixed limits (table 3). These tolerable deviations from the mean were updated in Bonn (1999) and Prague (2003) for some elements. The development of tolerable results from the 2nd to the 9th test is shown in table 7.

Table 7: Percentage of non tolerable results from the 2nd till the 9th Labtest

| Element | Tolerable deviation from mean (± %) | 2 nd Labtest 1997/1998 | | 3 rd Labtest 1997/1998 | | 4 th Labtest 1999/2000 | | 5 th Labtest 2001/2002 | |
|---------|---|--------------------------------------|--------------------------------|--------------------------------------|--------------------------------|--------------------------------------|--------------------------------|--------------------------------------|--------------------------------|

3.4 Evaluation by element

3.4.1 Nitrogen

The result is better than that of the year before – 6.1% of non-tolerable results could be found. Two laboratories (07 and 30) failed with three samples – laboratory 07 is also analysing level II samples this year for the ICP-Forests programme.

Laboratory 07 found the correct nitrogen content in sample 1, but in the other three samples the recovery is only 85-89%.

Laboratory 30 gave no information about the used method. The result of sample 1 is within the tolerable limits, but due to of the excessive standard deviation an outlier type 3 could be identified. This indicates that laboratory 3 has problems with the control of the used method.

3.4.2 Sulphur

In comparison with the 8th Interlaboratory Test the percentage of non-tolerable results is lower (8.3%). Laboratories 30 and 67 failed with three or four samples – but they are not analyzing level II samples this year.

Laboratory 30 gave no information about the used method - the results are too low, with only 51-73% recovery.

Laboratory 67 is using a not recommended method (see Stefan et al. 2000) - the results are constantly low (73 and 81% recovery).

3.4.3 Phosphorus

The results are really good only 4.3% of non-tolerable values, which is much better than the last test. Laboratories 15 and 30 failed with 3 samples – but they are not analyzing level II samples this year.

Four laboratories (05, 08, 64 and 72) are still using the not recommended dry-ashing methods, but their results are inside the tolerable limits. X-Ray analyzers show for the spruce samples higher results (laboratories 04, 04a, 37a and 38a), but most of these results are just within the tolerable limits.

3.4.4 Calcium

The results are very good only 4.3% of non-tolerable values, and they are much better than in the last test. Laboratories 30 and 74 failed with 3 or 4 samples – laboratory 74 is analysing level II samples for the ICP-Forests programme this year.

Laboratory 30 gave no information about the method employed and the results are scattered in a wide range from 14 to 89% recovery. The calcium results of laboratory 74 are constantly too low (80% recovery).

3.4.5 Magnesium

The results are really good with only 4.3% of non-tolerable values, and they are also better than in the last test. Laboratories 23 and 30 failed with 3 samples – laboratory 23 is also analysing level II samples for the ICP-Forests programme this year.

Laboratory 23 is using microwave digestion (HNO_3/HF) and ICP-AES without ultrasonic nebuliser. The result of sample 1 is within the tolerable limits (97% recovery) – the results of the samples 2-4 have only 81 to 49% recovery.

Laboratory 30 gave no information about the used method. The result of sample 1 is within the tolerable limits, but because of the excessive standard deviation an outlier type 3 could be identified. That means laboratory 3 has problems with the control of the method.

3.4.6 Potassium

A very good result with only 3.3% of non-tolerable values emerged. Only laboratory 30 failed with all samples.

3.4.7 Zinc

8.9% of non-tolerable values could be found – the result is not as good as in the last test. The zinc concentrations in sample 2, 3 and 4 are low (approximately 20 mg/kg). Laboratories 13, 46, 52 and 74 failed with these three samples – only laboratory 74 is analysing level II samples for the ICP-Forests programme this year.

3.4.8 Manganese

A very good result could be reached and all results are within the tolerable range, but the manganese concentrations in the four samples are high (538-1584 mg/kg).

3.4.9 Iron

The iron results were not so good as those in the last test (9.9% of non-tolerable results). Laboratories 04, 04a, 23 and 67 failed with three samples - laboratory 23 is also participating in the level II programme.

3.4.10 Copper

The copper results were not as good as those in the last test (10.8% of non-tolerable results) - only laboratory 05 failed with all samples. The highest percentage of non tolerable results could be found in sample 1 (23.7%). This sample has the lowest copper concentration (2.5 mg/kg). If the concentration is higher than 5 mg/kg (see sample 3 and 4) only 3.63% of non-tolerable results could be found.

3.4.11 Lead

The results are better than those the last test - 24% of non-tolerable results. A connection between concentration and percentage of non-tolerable results is given (see table 5). Laboratories 25, 32 and 64 failed with three or four samples – only laboratory 25 is also participating in the level II programme.

Two laboratories (08 and 64) are still using the not recommended dry-ashing methods.

3.4.12 Boron

The results were much better than those in the last test, 8.3% of outliers were found. No laboratory failed with 3 or 4 samples. Most of the laboratories are using closed acid digestion (quartz or Teflon vessels) and ICP determination. One laboratory (64) is still using a not recommended dry-ashing method.

3.4.13 Cadmium

A very good result for Cadmium was noted with only 7.1% of non-tolerable results. Only Laboratory 41 failed with three samples.

3.4.14 Carbon

A bad result for carbon emerged -11.1% of outliers were found. Laboratories 02, 08 and 23 failed with all samples. Because of the narrow variation in the recovery of the four samples of each laboratory it seems that these laboratories have a calibration problem.

Laboratory 23 is participating also in the level II programme this year.

4 CONCLUSIONS

The results of the 9th Interlaboratory Comparison Test show generally a good analytical quality in foliar analysis. Especially the results of the mandatory elements (N, S, P, Ca, Mg and K) are quite good and better than in the tests before.

Some of the laboratories had to learn from their ringtest results and had to improve their quality. They had to make a revision of their method, especially those with statistic outliers and/or results outside of the tolerable limits (laboratories 30, 23 and 74).

A few laboratories must change their methods completely (e.g. dry ashing, nephelometry determination of sulphur), because these methods are not recommended and not state of the art. Calibration problems with element analysers are back again. Most of the labs (close to 90%) are using control charts as a daily routine procedure.

A trend in the use of analytical methods can be seen:

- For C, N, (S) element-analyzers are becoming more and more important.
- Acid digestion methods in closed systems in combination with ICP methods are very good for the determination of S, P, K, Ca, Mg, Fe, Zn, B and Cu.
- Flameless-AAS and ICP-MS methods should be used for analysing Cd, Pb and Cu (especially for low concentrations)
- An X-ray fluorescence analysis is the method to generate good results for S, Ca, Mg, K, Zn and Mn, but X-Ray analyzers show for the spruce samples in this interlaboratory test higher phosphorous results.

NEW !!!

Sulfur & Carbon Analyzer SC 632 Series

The best way for accurate sulfur / carbon results in soil and plant samples

- The successor of the Leco SC 432 and SC 132 Series
- Detection limit 10 ppm for sulfur !!!
- Robust autoloader design
- 50 sample boats, maintenance free
- Improved combustion system, with 6 heating elements
- Leco CFR 21 Part 11 compliant software

Leco Instrumente GmbH
Marie - Bernays - Ring 31 - 41199 Mönchengladbach
+49 - 2166-687-0; www.leco.de

DIE NEUE VARIAN 700-ES ICP-OES SERIE

Es gibt Analysengeräte.

Und es gibt Varian Inc.

Die Leistungsfähigkeit simultaner Messung aller Elemente von ppb bis Prozentkonzentrationen, verwirklicht durch die einzigartigen CCD-Detektoren. Einfachste 'ON-STEP' Analyse spart Zeit und Argonkosten aufgrund des optimierten Plasmasystems.

Keine zweifache Probenmessung erforderlich - oder betrachten Sie Ihre Proben noch immer dual?

Die einfach zu bedienende und leistungsfähige ICP-Expert™ Software ermöglicht die schnelle Inbetriebnahme des Instrumentes, einfache Methodenentwicklung und eine effektive Anwenderführung. Vollständige PC-Steuerung aller Instrumentfunktionen mit schneller Geräteoptimierung. Höchste Verlässlichkeit des optischen Systems und des HF-Generators durch die Konstruktion frei von beweglichen Teilen.

- 5.5 Microwave digestion HNO₃/H₂O₂,
- 5.6 Microwave digestion HNO₃/H₂O₂/HF
- 5.7 Microwave digestion HNO₃/H₂O₂/HCl
- 5.8 Microwave aqua regia

6 Dry ashings (not recommended)

- 6.1 Dry ashing dissolution with HNO₃
- 6.2 Dry ashing dissolution with HNO₃/MgNO₃
- 6.3 Dry ashing dissolution with HNO₃/HF
- 6.4 Dry ashing dissolution with HNO₃/HCl
- 6.5 Dry ashing dissolution with HCl
- 6.6 Dry ashing dissolution with HCl/HF
- 6.7 Dry ashing, dissolution with H₂SO₄

7 Oxygen ashings

- 7.1 Oxygen ashing, Schöniger
- 7.2 Oxygen ashing, Wickbold
- 7.3 Oxygen ashing, calorimetric bomb

9 X-ray-pretreatments and other pretreatments

- 9.1 Material pressed (pellet)
- 9.2 Material melted and formed (tablet)
- 9.5 Melting (NaOH)

Method Code – Determination (D)

0 No information

1 No detection

10 Elemental-analyzers

11 Kjeldahl-apparatus
 11.1 Kjeldahl-apparatus (Tecator)
 11.2 Kjeldahl-apparatus (Gerhardt)
 11.3 Kjeldahl-apparatus (Büchi)

12 N-Analyzer
 12.1 N-Analyzer (Heraeus/Elementar)
 12.2 N-Analyzer (Vario)
 12.3 N-Analyzer (Leco)

13 C-Analyzer
 13.1 C-Analyzer (Leco)
 13.2 TOC Analyzer
 13.3 C-Analyzer (Heraeus/Elementar)

14 S-Analyzer
 14.1 S-Analyzer (Leco)

15 C/N-Analyzer
 15.1 C/N-Analyzer (Carlo-Erba=CE Instruments)
 15.2 C/N-Analyzer (Leco)
 15.3 C/N-Analyzer (Heraeus/Elementar)
 15.4 C/N-Analyzer (Vario)
 15.5 C/N-Analyzer (Hekatech)

16 C/S-Analyzer
 16.1 C/S-Analyzer (Leco)

17 C/N/S-Analyzer
 17.1 C/N/S-Analyzer (Leco)
 17.2 C/N/S-Analyzer (Heraeus/Elementar)
 17.3 C/N/S-Analyzer (Thermo Electron)
 17.4 C/N/S-Analyzer (Carlo-Erba=CE Instruments)

18 C/N/H-Analyzer
 18.1 C/N/H-Analyzer (Leco)
 18.2 C/H/N-Analyzer (Heraeus/Elementar)

19 C/H/N/S-Analyzer

20 Mono-Atom-Spectrometry-Techniques

21 AAS-flame technique
 21.1 AAS-flame technique (C₂H₂/Air)
 21.2 AAS-flame technique (C₂H₂/N₂O)

22 AAS-flameless (electrothermal technique)
 24 AAS-hydride technique
 25 AAS-cold vapor technique
 26 AFS-hydride-technique
 28 AES-Flame photometer

30 Multi-Atom-Spectrometry-techniques

31 ICP-AES without Ultrasonic nebulisation
 32 ICP-AES with Ultrasonic nebulisation
 35 ICP-MS

40 Physical techniques

41 X-ray-energy dispersive
 42 X-ray-wavelength dispersive
 45 Neutron activation analysis (NAA)
 47 Gamma-spectroscopy
 48 Laser diffraction

50 UV-VIS-spectrophotometry-techniques

- 51 Colorimetric N-Determination
- 51.1 Indophenol-blue-method
- 51.2 Flow Injection (FIAS)-NH3-Membrane-diffusion 566 nm
- 51.3 Continuous flow method, Indophenol blue

- 52 Colorimetric S-Determination
- 52.1 Nephelometry
- 52.2 Turbidimetry

- 53 Colorimetric P-Determination
- 53.1 Molybdene-blue-method
- 53.2 Vanadium-Mo-blue-method
- 53.3 Continuous flow method, Molybdene-blue

- 54 Colorimetric B-Determination
- 54.1 Azomethin - H
- 54.2 Carmine

60 Ion-chromatographic techniques

- 61.1 Anion-Chromatography w. chemical suppression
- 61.2 Anion-Chromatography w. electr. suppression

- 62.1 Kation-Chromatography w. chemical suppression
- 62.2 Kation-Chromatography w. electr. Suppression

70 Electrochemical methods

- 71 Conductimetry
- 71.1 Conductometric titration

- 72 Potentiometry
- 72.2 other ion selective electrodes

- 73 Potentiometric titrations
- 74 Stripping potentiometry
- 75 Voltammetry
- 76 Polarography
- 77 Amperometry
- 78 Electrophoresis
- 79 Redox potential

80 Classical analytical techniques

- 81 Gravimetry
- 82 Titration
- 82.1 NH4-back titration
- 82.2 Thiocyanate-titration
- 82.3 FeNH4SO4-Titration
- 82.4 Barimetric titration
- 82.5 AgNO3-Titration

90 other detections

List of abbreviation

| | |
|------------|--|
| No. | Number of result ordered by Lab. mean |
| Lab. Code | Code of the laboratory / Laboratory which are analysing level II samples 2003/2004 are marked with x |
| P | Code for pre-treatment method (s. method code pre-treatment) |
| D | Code for determination method (s. method code determination) |
| Lab. mean | Mean of the results of each laboratory without outliers type 1 |
| n | Number of all results from this laboratories without outliers type 1, 2, 3 |
| N | Number of all results from all laboratories without outliers type 1, 2, 3 |
| Mean | Total mean value from all results without outliers type 1, 2, 3 |
| Si | Standard deviation from each laboratory without outliers type 1 |
| SI | Mean Standard deviation for all laboratories without outliers type 1, 2, 3 |
| Vi | Si*100/Lab. mean |
| VI | SI*100/Mean |
| Recovery % | Lab.mean * 100/Mean |
| a | Outlier type 1 |
| b | Outlier type 2 |
| c | Outlier type 3 |
| * | Not tolerable mean value from one laboratory (see table 3) |

Annex - Results

Mandatory parameters (S, N, P, Ca, Mg, K)

Optional parameters (Zn, Mn, Fe, Cu, Pb, B, Cd, C)

Additional parameters
