1 INTRODUCTION

The concern about an increased observation of unknown damage to forests in Europe led in the 1980's to the establishment of the following two European programmes for the protection of forests against atmospheric pollution and other stress factors:

The International Cooperative Programme on Assessment and Monitoring of Air Pollution Effects on Forests (ICP-Forests) and the European Union Scheme on the Protection of Forests against Atmospheric Pollution. In the framework of these two programmes a large-scale 16x16km transnational monitoring network (level I) was established and on this grid annual crown condition surveys have been carried out since 1986/87. In addition to these observations surveys of the forest soil condition and of the chemical content of needles and leaves were carried out in 1995 (Stefan et al. 1997).

For the intensive monitoring programme (Level II) more than 860 permanent observation plots have been established in Europe with the aim of investigating key factors and processes at the ecosystem scale. The foliar survey at Level II is mandatory and the analysis must be carried out at least every two years (1995, 1997, 1999, 2001, 2003).

A high quality and comparable laboratory standard in all countries is indispensable for a European-wide survey of the state of forests. Important steps on this way have been the publication of the "Manual on methods and criteria for harmonised sampling, assessment, monitoring and analysis of the effects of air pollution on forests" (UN-ECE, Hamburg and Prague 1994) and the performance of the first European Foliar- Interlaboratory Comparison Test on two certified standards (BCR 100-beech leaves and BCR 101 - spruce needles) by 24 laboratories from 21 countries, organised by France in 1993.

The intensive discussion of the forest foliar expert panel in As/Norway (1994) ended with the recommendation of a second test with 4 unknown samples (two spruces, one pine, one oak) during the running level-II monitoring programme. This was organised by Germany in 1995/96 and subsequently discussed by the expert panel in Vienna/Austria in 1997. The expert panel decided to call for a complete repetition and authorised the Landesumweltamt North-Rhine-Westfalia (LUA) to arrange interlaboratory comparison tests on foliage every two years. The 3rd test (Bartels 1998) with 5 unknown samples and its consequences for the analytical quality management were intensively discussed in Bonn in 1999 and ended with a revision of Part IV "Sampling and analysis of needles and leaves" of the above mentioned manual (Stefan et al. 2000).

52 Laboratories from 29 European countries took part in the 4th Needle/Leaf Interlaboratory Comparison Test 1999/2000. In comparison with the 3rd test, the results show a distinct improvement of analysis quality of European laboratories working on the issue of forestry analysis (Bartels 2000).

The 5th Interlaboratory Comparison Test was also organized by the LUA (Bartels 2002). In general, the results show good analytical quality in the participating laboratories, but it was very surprising that some laboratories have problems with carbon in foliar samples. The results were discussed by the Expert Panel in Prague/Czech Republic in April 2003. The Panel discussed the difficulties that some laboratories encounter in using new laboratory equipment and the lack of experienced technical staff. Good analytical quality can only be obtained by daily

practice and with good quality control. This quality practice must also become a tradition for each laboratory and for each member of the staff.

Because of the good results, the Panel has established smaller tolerable limits of $\pm 15\%$ for zinc and manganese and of $\pm 20\%$ for copper.

Following the the retirement of Mr. Bartels from the Panel, the Forest Foliar Coordinating Centre (FFCC) organised the 6th Interlaboratory Comparison Test. FFCC conceived a web-based interface to an Oracle database to which data input and validation could be made via internet by the participating laboratories. The results of this Interlaboratory Comparison Test were evaluated according to DIN 38402/42. The results of the 6th Interlaboratory Comparison Test show generally a good analytical quality in foliar analyses. Only a few of the laboratories had to adjust to the results from their ringtest and others had to change their methods (e.g. dry ashing). Also, a well trained staff is the basis for good results and most of the labs are now using quality control charts.

To improve the quality of foliar analysis, the Expert Panel and the FFCC decided to carry out this ringtest annually. Ringtests should not only be a check of the level II data quality, but they should also support the laboratories to get better results before they send the next level II results to the Programme Coordinating Centre (PCC). That was the reason why the 7th Interlaboratory Comparison Test was started in 2004.

Till now, there were no direct connections between the foliage results of the level II survey and the results of the annual interlaboratory tests. To link this quality information directly to the level II datasets, changes where made in the level II submission forms (*.fom and *.foo). At the Task Force Meeting 2005 and at the 9th Expert Panel Meeting 2005 (Newtownmountkennedy / Ireland) these changes were accepted. Also the coded results of the 8th Interlaboratory Comparison Test will be sent to the PCC and the Joint Research Centre (Ispra). With this information it is possible to link quality information directly with level II monitoring results.

The 9th Interlaboratory Comparison Test was the last one financed within the Forest Focus programme. To avoid the same situation like in the 6th Test (no co financing from EC), other sources for financing must be found for this Interlaboratory test programme in future. A great majority of the participating laboratories agreed to pay a participation fee in future to continue this annual test programme, if there are no other sources for financing.

Lower tolerable limits for the mandatory parameters S to $\pm 15\%$ and for P, Ca, Mg and K to $\pm 10\%$ were fixed at the Expert Panel Meeting in Madrid in April 2007, because of the improvement of the data quality in most of the laboratories. The 10th Interlaboratory Test was evaluated with these smaller limits.

The QA/QC-topic is getting more important in ICP-Forests - a separate QA/QC group for laboratories was set up. This group developed the manual "Quality Assurance and Control in Laboratories - A review of possible quality checks and other forms of assistance" in May 2008. The first meeting of the heads of the ICP-Forests laboratories was held in Hamburg in June 2008.

With the start of the Life+ project "*Further development and Implementation of an EU-Level Forest Monitoring System*" (FutMon) in the beginning of 2009, QA/QC activities are financed for all countries participating in this project. The ringtest is open for all laboratories. A new system for qualification and re-qualification was set

up for 2009. After the ringtest each participant will receive a qualification report. It has been decided to qualify the results of each parameter separately. If 50% or more of the results for this parameter for all the samples of the ringtest are within the tolerable limits, the laboratory is qualified. Re-qualification is mandatory for laboratories of the FutMon partners and recommended for ICP-Forests laboratories.

Key quality parameters like ringtest results or limit of quantification (LOQ) per parameter will be submitted with the monitoring data in a separate QA/QC file.

The re-qualification process for the 11th test was finished mid of October 2009. Most of the laboratories passed the re-qualification test. Sulphur is the most difficult element; three laboratories have submitted no data, because they have no suitable tools to determine sulphur over this concentration range. So they plan to buy a new tool or to search for another qualified laboratory which is able to analyse sulphur in foliage and litterfall.

2 TASK, MATERIAL, PARTICIPANTS AND EVALUATION

2.1 Task

The Forest Foliar Coordinating Centre established the following timetable:

- Informing the participating labs (March/April 2009)
- Registration of 56 participants via internet (6th July 2009)
- Submission of the ring test samples (July/August 2009)
- Input of the results from the labs (October-December 2009)
- Deadline of data input (3rd January 2010)
- Evaluation according to DIN 38402/42 (January/February 2010)
- Final Report and qualification reports (February/March 2010)
- Re-qualification process finished (1st October 2010)

The mandatory parameters S, N, P, Ca, Mg, K and C must be analysed, optional parameters Zn, Mn, Fe, Cu, Pb, Cd and B can be analysed and some additional elements are possible. The units and all possible elements are shown in figure 1.

Figure 1: Elements and units

1 H																	2 He		
3 Li µg/g	4 Be													5 B µg/g	6 C %	7 N mg/g	8 O µg/g	9 F µg/g	10 Ne

	Mandatory for FutMon				Optional for FutMon									Additional			Not possible		

For each element four replicates per sample are necessary within this Interlaboratory Test. All results must be calculated on dry weight (105°C).

For a deeper evaluation - all participant laboratories had to fill a questionnaire with purpose to obtain information about the status of their quality control systems and they were asked if they have analysed level II foliar, litterfall or ground vegetation samples for the Life+/FutMon project in 2009/2010.

2.2 Material

At the end of July 2009 the Austrian Federal Research Centre for Forests, Natural Hazards and Landscape (BFW) sent four dried and powdered plant samples to 56 laboratories in 30 countries.

The samples consisted of:

1. Spruce needles (Finland)
2. Oak leaves (France) - same sample like in the 8th Test (Sample 4)
3. Bears garlic (Switzerland)
4. Spruce needles (Austria)

All materials were dried, ground and homogenised. Before the samples were sent they were once more homogenized in the BFW-laboratory and were filled in PE-bags. Homogeneity was tested for each of these four samples by analysing the nitrogen and carbon content in eight randomly selected sub samples. No significant variation was found between the results of these eight samples, and they were therefore considered to be homogeneous.

Special thank to John Derome (Finland), Mireille Barbaste (France), Peter Waldner (Switzerland) and their employees for collecting and preparing samples for this ringtest.

2.3 Participants

Table 1 shows the number of countries and laboratories taking part in the ten interlaboratory comparison tests.

Table 1: Number of countries and laboratories taking part in the twelve interlaboratory comparison tests

Interlaboratory Comparison Test	Number of countries	Number of laboratories
1 st	21	24
2 nd	25	39
3 rd	29	51
4 th	29	52
5 th	29	53
6 th	26	46
7 th	23	43
8 th	30	52
9 th	28	53
10th	29	54
11th	28	56
12th	30	56

With a few exceptions, all laboratories analysed in the 12th Interlaboratory Comparison Test the complete list of mandatory elements and most of the optional elements (s. Table 2).

Table 2: Analysed elements from the participant laboratories (green); no results were sent (grey); monitoring samples were analyzed this year marked with “X”

2.4 Data Evaluation

Only four results above the quantification limits can be used for the evaluation. Results below the quantification limit are marked with “<” followed by the quantification limit of the laboratory (e.g. <0.1).

The results of the interlaboratory comparison test were evaluated according to DIN 38402/42. This type of evaluation is easy to do and requires no special computer programme. But, only by using robust statistics are the results really free of manipulation by the test leader. The differences between these two types of evaluation methods are not very big (Bartels 1996, Fürst 2004).

The DIN 38402/42 method identifies three types of outliers. With the Grubbs-test the four replicates from each laboratory can first be checked for outliers (outlier type 1). The next step is to compare the recalculated mean values of each lab with the mean value from all labs as well as with the Grubb-test for outliers (type 2). Finally, the recalculated standard deviation from the laboratories must be compared with the total standard deviation (F-test) to eliminate laboratories with an excessive standard deviation (outlier type 3). Now the outlier free total mean value and the outlier free maximum and minimum mean value of all labs can be calculated. Marked outliers type 1 between the outlier free maximum and minimum mean value are not longer outliers, they can be used for the further evaluation of the interlaboratory comparison test. The last step is to calculate the outlier free statistical values.

With the outlier free mean value for each element/sample and the laboratory mean value the recovery must be calculated and compare with the tolerable limits from table 3. Laboratory results inside this tolerable limits are marked green, outside they are marked orange. This type of evaluation was fixed in the Foliar Expert Panel Meetings of As (1994) and Vienna (1997).

Table 3: Tolerable limits for normal concentration in foliage for the mandatory and optional elements

Fe	70-130	20µg/g
Pb	60-140	0.5µg/g
B	70-130	5µg/g

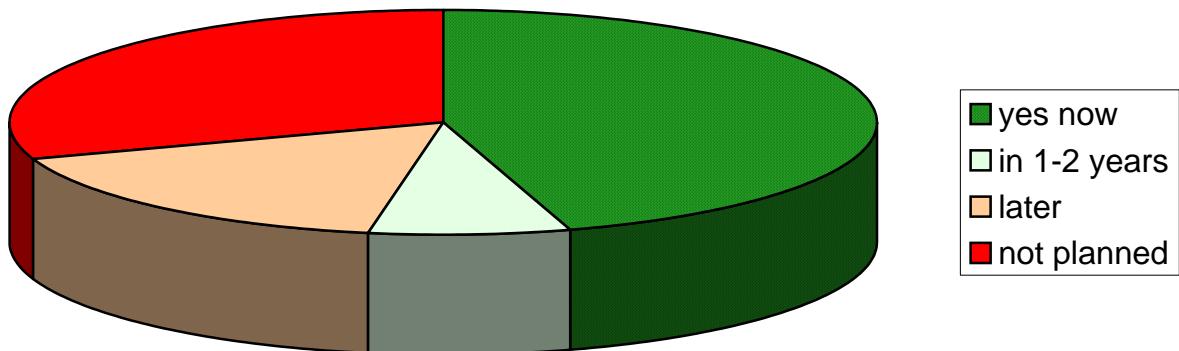

3 RESULTS

3.1 Main results of the questionnaire

All participating laboratories should fill a questionnaire in order to obtain information about the status and changes of their quality control systems. 53 of the 56 laboratories submit this questionnaire.

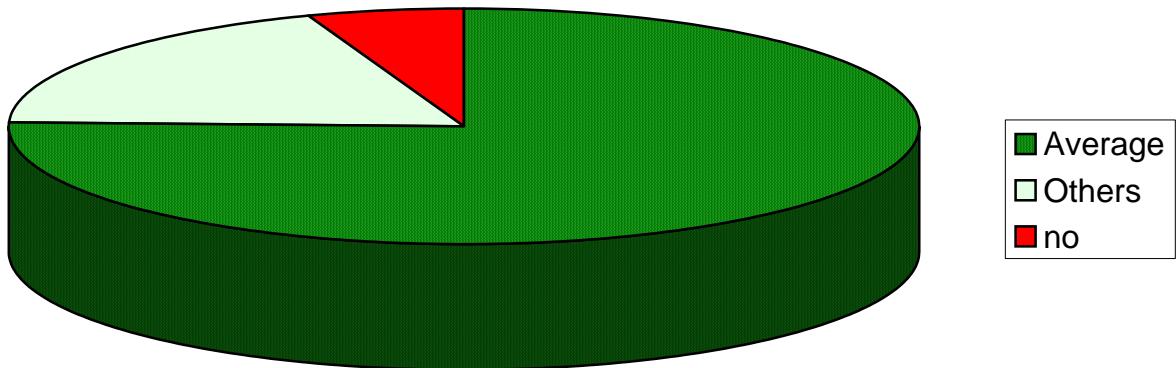

The first questions dealt with the accreditation status of the laboratories and the summarized results are shown in figure 2.

Figure 2: Accreditation status according EN 17025 (n=53)

52% of the laboratories are accredited now (24 labs) or plan an accreditation within 1-2 years (4 labs) - 16 laboratories don't plan an accreditation.

The next important question was about the usage of control charts for quality control. 94.3% of this 53 laboratories are using control charts, and most of them are using average control chart (80%) – 3 of this 53 laboratories are using no control chart.

Figure 3: Usage of control charts in foliar laboratories (n=53)

3.2 Results of the 12th Interlaboratory Comparison Test

Table 4 gives an overview as to which laboratories analysed the test samples well and which encountered quality problems. This evaluation is based on the tolerable limits from table 3 and table 3a. A green marked field means all four samples are analysed well, a grey marked field means no results were sent from this laboratory till January 2009. The red marked “<” or “>” mean number of results lower or higher the tolerable limit.

The following participants, which have a higher percentage of non-tolerable results (above 20%) of the total results, have bigger QC/QA-problems in their laboratory:

F22 (42.9%), A43 (40.6%), A59 (33.3%), F24 (32.1%), F04 (32.1%), A62 (31.3%), F26 (28.6%), A49 (28.6%), A57 (25.0%) and A42 (25.0%).

Some laboratories are within the tolerable limits (see table 3), but the statistical evaluation shows an excessive standard deviation (outlier type 1 or 3), that means they had methodical problems. These results are marked with “a” or with “c” in the detailed evaluation in the annex.

Table 4: Results of the 12th Interlaboratory Comparison Test – results marked with the limits from table 3 and 3a (green = all four samples were analysed well; < = too low; > = too high; grey = no results were sent)

Laborcode	N	S	P	Ca	Mg	K	C	Zn	Mn	Fe	Cu	Pb	Cd	B
F23												>>		
F24			<>	>>>	>>>	<								
F25												>		
F26	>	>>	>>				<<<

3.3 Comparison between the 12th Interlaboratory Comparison Test and former tests

Sample 4 of the 8th and sample 2 of the 12th Interlaboratory Comparison Tests were identical (Oak Leaves - France). For all elements the mean values harmonize very well (Table 6).

Table 6: Comparison between the 8th and 12th Interlaboratory Comparison Test

Element (Unit)	8 th Interlaboratory Comparison Test (Sample 4)		12 th Interlaboratory Comparison Test (Sample 2)	
	Mean	Number of Labs	Mean	Number of Labs
N mg/g	9,44	48	9,56	53
S mg/g	0,84	47	0,89	50
P mg/g	0,49	49	0,48	53
Ca mg/g	10,46	49	10,30	54
Mg mg/g	1,15	47	1,16	54
K mg/g	2,97	49	2,92	54
C g/100g	49,16	35	49,36	47
Zn µg/g	26,93	39	27,27	43
Mn µg/g	1257	43	1271	44
Fe µg/g	239,6	42	234,6	42
Cu µg/g	5,83	37	5,79	40
Pb µg/g	2,63	29	2,70	30
Cd ng/g	94,52	28	94,07	28
B µg/g	25,45	22	25,32	23

The ringtest is evaluated on the basis of fixed limits (table 3 and 3a). These tolerable deviations from the mean were updated in Bonn (1999), Prague (2003), Madrid (2007) and Hamburg 2009 for some elements. The changes of the tolerable results from the 2nd to the 12th test are shown in tables 7a and 7b.

Table 7a: Percentage of non tolerable results from 2nd till 7th test

³⁾ 8th and 9th test / 10th, 11th and 12th test⁴⁾ special tolerable limits for low concentrations

3.4 Evaluation by element

3.4.1 Nitrogen

7.6 % of non-tolerable results; one laboratory (A59) was obviously submitting the results in a wrong unit (g/100g instead mg/g). In comparison with the 11th Interlaboratory Test the percentage of non-tolerable results was lower (10.9→7.6%), but this is no surprise because a sample with a low nitrogen content was missing in this test. Differences between the *Kjeldahl* method and the element analyzers can be seen especially in the results of sample 3 (bears garlic). This sample has high nitrogen and also high nitrate content – nitrate cannot be determined completely by the *Kjeldahl* method.

The laboratories A59 and A61 failed in analyzing three or four samples. Laboratory A61 is a *FutMon-Laboratory* and had to re-qualify.

3.4.2 Sulphur

In comparison with the 11th Interlaboratory Comparison Test the percentage of non-tolerable results is a little bit higher (14.4→16.5%). Sulphur is still a difficult mandatory element for the laboratories.

The laboratories A58, A71, F22, F27 and F30 failed in analyzing three or four samples. The laboratories A58, F22 and F27 are using CNS element-analyzers for sulphur - it seems that these laboratories have calibration problems with their element-analyzers. Especially the high sulphur concentration (11.66 mg/g) in sample 3 (Bears garlic) made a lot of problems – 22% non-tolerable results are quite high for this sulphur concentration!

Laboratory A71 was using an obsolete turbidimetric method. The laboratories A58, F22, F27 and F30 are *FutMon-Laboratories* and had to re-qualify.

3.4.3 Phosphorus

In comparison with the 11th Interlaboratory Comparison Test the percentage of non-tolerable results is quite on the same level (14.2→13.7%).

The laboratories A39, A55, A59 and F22 failed in analyzing three or four samples. The Laboratory F22 is a *FutMon-Laboratory* and had to re-qualify.

3.4.4 Calcium

In comparison with the last test the percentage of non-tolerable results is lower (19.1→9.7%). Only the laboratory F24 failed in analyzing three or four samples. This Laboratory is a *FutMon-Laboratory* and had to re-qualify.

3.4.5 Magnesium

The result is bad, 14.4% of the results were non-tolerable. The laboratories A43, A57, F04, F13 and F24 failed in analyzing three or four samples. The laboratories A43, F04, F13 and F24 are *FutMon-Laboratories* and had to re-qualify.

3.4.6 Potassium

In comparison with the 11th Interlaboratory Comparison Test the percentage of non-tolerable results is much lower ($17.5 \rightarrow 6.0\%$). The laboratories A43 and F03 failed in analyzing three or four samples. Both laboratories are *FutMon-Laboratories* and had to re-qualify.

3.4.7 Carbon

The result is better than in the last Interlaboratory Comparison Test, 8.5% of the results were non-tolerable. The laboratories A49, A59 and F26 failed in analyzing three of the four samples. It seems that these laboratories have calibration problems with their element-analyzers. The Laboratory F26 is a *FutMon-Laboratory* and had to re-qualify.

3.4.8 Zinc

6.4% of the results were non-tolerable – the result is quite the same like in the last test. Three laboratories A43, F11 and F15 failed in analyzing three or four samples. The laboratories A43, F11 and F15 are *FutMon-Laboratories* and had to re-qualify.

3.4.9 Manganese

2.7% of the results were non-tolerable – the result is better than in the last test. No laboratory failed with three or four samples.

3.4.10 Iron

In comparison with the last test the percentage of non-tolerable results is lower ($13.1 \rightarrow 4.8\%$). No laboratory failed with three or four samples.

3.4.11 Copper

The result is bad, 21.3% of the results were non-tolerable. The laboratories A56, F05, F14, F19 and F20 failed in analyzing three or four samples. The laboratories F05, F14, F19 and F20 are *FutMon-Laboratories* and had to re-qualify.

3.4.12 Lead

The result seems not so good like in the last test, only 13.3% of the results were non-tolerable, but the concentrations of three of the four samples are below 0.5 mg/g. No laboratory failed in analyzing three or four samples.

3.4.13 Cadmium

In comparison with the last test the percentage of non-tolerable results was higher ($7.7 \rightarrow 10.7\%$). Laboratory A49 and A56 failed in analyzing four samples.

3.4.14 Boron

A really good result only 5.4% of the results was non-tolerable. Only laboratory A46 failed in analyzing all samples.

4 CONCLUSIONS

56 laboratories in 30 countries participated in the 12th Needle/Leaf Interlaboratory Test. With the start of the Life+ project "*Further development and Implementation of an EU-Level Forest Monitoring System*" (FutMon) at the beginning of 2009, QA/QC activities are financed for all countries participating in this project.

There is a new system for qualification and re-qualification started with the last test in 2009. Together with the ring test report each participant will receive a qualification report. It has been decided to qualify the results of each parameter separately. If 50% or more (two, three or all four samples) of the results for this parameter for all the samples of the ring test are within the tolerable limits, the laboratory is qualified. Re-qualification is mandatory for laboratories of the FutMon partners and recommended for all ICP-Forests laboratories.

This quality feedback and the following improvement in the practical laboratory work after the 11th Interlaboratory Comparison Test show here the first positive effect. The results of a lot of participating laboratories are in the 12th Interlaboratory Comparison Test better than before.

Only the following participants, which have a higher percentage of non-tolerable results (above 20%) of the total results, have bigger QC/QA-problems in their laboratory:

F22 (42.9%), A43 (40.6%), A59 (33.3%), F24 (32.1%), F04 (32.1%), A62 (31.3%), F26 (28.6%), A49 (28.6%), A57 (25.0%) and A42 (25.0%).

A clear improvement in quality for nitrogen, calcium, magnesium, potassium, carbon, manganese, iron and boron can be found. In future, an improvement is needed for sulphur - a mandatory parameter - and for the optional parameter copper.

The questionnaire about the status of the QA/QC system was returned by 53 laboratories - 24 of these laboratories are accredited now and four laboratory plan an accreditation within 1-2 years.

Control charts are used as a quality control instrument in daily routine - only three of the 53 laboratories are using no control charts.

Method Code – Pretreatment (P)

0 No information

1 No pre-treatment

2 Extractions

- 2.3 Extraction aqua regia
- 2.7 Extraction H₂O
- 2.8 Extraction HNO₃

3 Wet ashings at room pressure (open system)

- 3.1 Wet ashing HNO₃
- 3.10 Wet ashing HNO₃/H₂SO₄
- 3.11 Wet ashing aqua regia
- 3.2 Wet ashing HNO₃/HF
- 3.20 Wet ashing HClO₄/H₂O₂
- 3.21 Wet ashing HClO₄/H₂SO₄
- 3.3 Wet ashing HNO₃/HClO₄
- 3.31 Wet ashing H₂SO₄/H₂O₂
- 3.32 Wet ashing H₂SO₄/K₂CrO₇
- 3.4 Wet ashing HNO₃/HClO₄/HF
- 3.5 Wet ashing HNO₃/H₂O₂
- 3.50 Kjeldahl H₂SO₄/Se-catalyst
- 3.51 Kjeldahl H₂SO₄/Cu-catalyst
- 3.52 Kjeldahl H₂SO₄/Ti-Cu-catalyst
- 3.53 Kjeldahl H₂SO₄/Hg-catalyst
- 3.6 Wet ashing HNO₃/HClO₄/H₂SO₄
- 3.7 Wet ashing HNO₃/HClO₄/CaCl₂
- 3.8 Wet ashing HNO₃/HClO₄/H₂O₂
- 3.9 Wet ashing HNO₃/HClO₄/HCl

4 Pressure digestions (closed system)

- 4.1 Pressure digestion HNO₃,
- 4.2 Pressure digestion HNO₃/HF
- 4.3 Pressure digestion HNO₃/HClO₄
- 4.4 Pressure digestion HNO₃/HClO₄/HF
- 4.5 Pressure digestion HNO₃/H₂O₂

5 Microwave pressure digestions (closed system)

- 5.1 Microwave digestion HNO₃,
- 5.2 Microwave digestion HNO₃/HF
- 5.3 Microwave digestion HNO₃/HClO₄
- 5.4 Microwave digestion HNO₃/HClO₄/HF
- 5.5 Microwave digestion HNO₃/H₂O₂,
- 5.6 Microwave digestion HNO₃/H₂O₂/HF
- 5.7 Microwave digestion HNO₃/H₂O₂/HCl
- 5.8 Microwave aqua regia

6 Dry ashings (not recommended)

- 6.1 Dry ashing dissolution with HNO₃
- 6.2 Dry ashing dissolution with HNO₃/MgNO₃
- 6.3 Dry ashing dissolution with HNO₃/HF
- 6.4 Dry ashing dissolution with HNO₃/HCl
- 6.5 Dry ashing dissolution with HCl
- 6.6 Dry ashing dissolution with HCl/HF
- 6.7 Dry ashing, dissolution with H₂SO₄

7 Oxygen ashings

- 7.1 Oxygen ashing, Schöniger
- 7.2 Oxygen ashing, Wickbold
- 7.3 Oxygen ashing, calorimetric bomb

9 X-ray-pretreatments and other pretreatments

- 9.1 Material pressed (pellet)
- 9.2 Material melted and formed (tablet)
- 9.5 Melting (NaOH)

Method Code – Determination (D)

0 No information

1 No detection

10 Elemental-analyzers

11 Kjeldahl-apparatus
 11.1 Kjeldahl-apparatus (Tecator)
 11.2 Kjeldahl-apparatus (Gerhardt)
 11.3 Kjeldahl-apparatus (Büchi)

12 N-Analyzer
 12.1 N-Analyzer (Heraeus/Elementar)
 12.2 N-Analyzer (Vario)
 12.3 N-Analyzer (Leco)

13 C-Analyzer
 13.1 C-Analyzer (Leco)
 13.2 TOC Analyzer
 13.3 C-Analyzer (Heraeus/Elementar)

14 S-Analyzer
 14.1 S-Analyzer (Leco)

15 C/N-Analyzer
 15.1 C/N-Analyzer (Carlo-Erba=CE Instruments)
 15.2 C/N-Analyzer (Leco)
 15.3 C/N-Analyzer (Heraeus/Elementar)
 15.4 C/N-Analyzer (Vario)
 15.5 C/N-Analyzer (Hekatech)

16 C/S-Analyzer
 16.1 C/S-Analyzer (Leco)

17 C/N/S-Analyzer
 17.1 C/N/S-Analyzer (Leco)
 17.2 C/N/S-Analyzer (Heraeus/Elementar)
 17.3 C/N/S-Analyzer (Thermo Electron)
 17.4 C/N/S-Analyzer (Carlo-Erba=CE Instruments)

18 C/N/H-Analyzer
 18.1 C/N/H-Analyzer (Leco)
 18.2 C/H/N-Analyzer (Heraeus/Elementar)

19 C/H/N/S-Analyzer

20 Mono-Atom-Spectrometry-Techniques

21 AAS-flame technique
 21.1 AAS-flame technique (C₂H₂/Air)
 21.2 AAS-flame technique (C₂H₂/N₂O)

22 AAS-flameless (electrothermal technique)
 24 AAS-hydride technique
 25 AAS-cold vapor technique
 25.1 AAS-LECO/ALTEC Mercury Analyzer
 26 AFS-hydride-technique
 28 AES-Flame photometer

30 Multi-Atom-Spectrometry-techniques

31 ICP-AES without Ultrasonic nebulisation
 32 ICP-AES with Ultrasonic nebulisation
 35 ICP-MS

40 Physical techniques

41 X-ray-energy dispersive
 42 X-ray-wavelength dispersive
 45 Neutron activation analysis (NAA)
 47 Gamma-spectroscopy
 48 Laser diffraction

50 UV-VIS-spectrophotometry-techniques

- 51 Colorimetric N-Determination
- 51.1 Indophenol-blue-method
- 51.2 Flow Injection (FIAS)-NH3-Membrane-diffusion 566 nm
- 51.3 Continuous flow method, Indophenol blue

- 52 Colorimetric S-Determination
- 52.1 Nephelometry
- 52.2 Turbidimetry

- 53 Colorimetric P-Determination
- 53.1 Molybdene-blue-method
- 53.2 Vanadium-Mo-blue-method
- 53.3 Continuous flow method, Molybdene-blue

- 54 Colorimetric B-Determination
- 54.1 Azomethin - H
- 54.2 Carmine

60 Ion-chromatographic techniques

- 61.1 Anion-Chromatography w. chemical suppression
- 61.2 Anion-Chromatography w. electr. suppression

- 62.1 Kation-Chromatography w. chemical suppression
- 62.2 Kation-Chromatography w. electr. Suppression

70 Electrochemical methods

- 71 Conductometry
- 71.1 Conductometric titration

- 72 Potentiometry
- 72.2 other ion selective electrodes

- 73 Potentiometric titrations
- 74 Stripping potentiometry
- 75 Voltammetry
- 76 Polarography
- 77 Amperometry
- 78 Electrophoresis
- 79 Redox potential

80 Classical analytical techniques

- 81 Gravimetry
- 82 Titration
- 82.1 NH4-back titration
- 82.2 Thiocyanate-titration
- 82.3 FeNH4SO4-Titration
- 82.4 Barimetric titration
- 82.5 AgNO3-Titration

90 other detections

List of abbreviation

No.	Number of result ordered by Lab. mean
Lab. Code	Code of the laboratory / Laboratory which are analysing level II samples are marked with x
P	Code for pre-treatment method (s. method code pre-treatment)
D	Code for determination method (s. method code determination)
Lab. mean	Mean of the results of each laboratory without outliers type 1
n	Number of all results from this laboratories without outliers type 1, 2, 3
N	Number of all results from all laboratories without outliers type 1, 2, 3
L	Number of all laboratories without outliers type 2, 3
Mean	Total mean value from all results without outliers type 1, 2, 3
Si	Standard deviation from each laboratory without outliers type 1
SI	Mean Standard deviation for all laboratories without outliers type 1, 2, 3
Vi	Si*100/Lab. mean
VI	SI*100/Mean
SR	Standard deviation from all results without outliers
VR	SR*100/Mean
Recovery %	Lab.mean * 100/Mean
a	Outlier type 1
b	Outlier type 2
c	Outlier type 3
*	Not tolerable mean value from one laboratory (see table 3)

Annex - Results

Mandatory parameters (N, S, P, Ca, Mg, K, C)

Optional parameters (Zn, Mn, Fe, Cu, Pb, Cd, B)

Additional parameters
